

Conditions

```
const grade = 3;

if (grade >= 10) {
  console.log("Passing grade");
} else {
  console.log("Failing grade");
}

const grade = 10;

if (grade > 10) {
  console.log("Passing grade");
} else if (grade === 10) {
  console.log("Passing on the limit");
} else {
  console.log("Failing grade");
}
```

Since this function is performing two different actions based on the result of the if condition and its opposite (else), then we can rewrite it by dropping the else keyword:

```
function canVote(age) {
  if (age >= 18) {
    return true;
  }
  return false;
}
```

Always use triple equals (===) when comparing the equality of 2 values in JavaScript.

Whenever you're returning a boolean (true or false), it's quite redundant to use if and else

```
function isPassing(grade) {
  if (grade >= 10) {
    return true;
  } else {
    return false;
  }
}

isPassing(12);
```

It can be written using the ternary operator as follows:

```
function evenOrOdd(number) {
  return (number % 2 === 0) ? "even" : "odd";
}

condition ? expressionWhenTrue : expressionWhenFalse
```
