

Variables

let

```
let name = "Sam";  
console.log(name);
```

Variables defined with `let`, can be re-assigned later on:

```
let language = "C++";  
language = "JavaScript";
```

Variables defined with `const` cannot be re-assigned. This means you can use the `=` sign only once when defining the variable. Here's an example:

```
const language = "C++"; // Cannot be re-assigned anymore  
console.log(language); // "C++"
```

```
language = "Python" // ❌ Type error: this will break your script
```
